

The TALPAweb application is a complete package that simplifies surface condition reporting for your airport with the use of any internet enabled device, from mobile phones to desktop computer. It is simple to use and can be operated "on the fly" even from within a vehicle, all while meeting Federal Aviation Administration (FAA) requirements for surface condition reporting.

With TALPAweb, anyone can generate a surface condition report on one or all runways just by selecting from drop-down boxes of possible choices. It has been tested in real-life situations to ensure that your staff will be able to adapt to it with minimal training. The advanced security give users peace of mind because TALPAweb uses Secure Sockets Layer and WPA encryption where available, along with other advanced security measures.

Seconds after completion your NOTAM will be ready for automated entry into the NOTAM Manager. As well information can be passed to registered stakeholders. TALPAweb takes care of ensuring the report is validated by our servers to be compliant with NOTAM and FICON specifications, making it impossible to submit invalid data. Using TALPAweb, you don't need to be concerned with miscommunications between your airport and the FAA in reporting surface conditions. As new reporting standards such as TALPA are changed throughout the United States in the coming years, TALPAweb will change to meet all of these requirements, without the need for purchasing costly new products and retraining of staff. When reporting standards change, you will be ready.

Compatible with: iOS (Apple), Android tablets and smart phones as well as computers running Windows or Mac.
